## **Preface**

Maintaining elephants in conditions alien to their natural living environment, with little or no opportunity to perform species-typical activities may result in expression of abnormal behaviors. Historical antecedents of elephant keeping in the royal stables of Rajasthan have been used as an excuse to continue the practice of maintaining captive elephants in Jaipur.

The princely state of Rajputana was one of the richest during and even before the British Raj. The care and wealth that was expended on the royal elephants was legendary. With the abolition of the Privy Purse in 1971, these elephants became an economic burden on the depleted wealth of the Maharajahs or the kings and princes. They were given away to their mahouts or handlers, who overnight changed status from employees of the royal palaces to commercial vendors, trying to eke out a living with the elephant.

Since then, elephant trade became lucrative and flourished in Rajasthan, as it's an internationally acclaimed tourist destination. Tourists in Jaipur are wooed with elephant rides, elephants with calves are found begging on roads and posing for photographs, elephants are made to carry tourists on their backs in unsuitable weather and on hard tar roads, as well as performing other activities.

There has been no initiative so far to study the ecological and physiological needs of elephants in a deviant environment which is in sharp contrast to their natural forest or grassland homes. This investigation is an attempt to gain some knowledge about the species in this human dominated and influenced surroundings. This document has three sections; section one presents the results of the welfare status of the elephants, covering aspects such as; purpose of keeping, source of elephants, shelter provided or available to them, accessibility of water and related features, sleep, exercise, social interactions, behaviour, work, provision of food, reproductive and health status of elephants kept in this region. There were several constraints in extracting the actual ground status of the parameters, however, this section describes the available details of each parameter and its deviation from what an elephant in natural conditions is exposed to.

Section two provides a comprehensive list of elephants kept in this region; with details of their name, age and sex. Section three, titled fact sheets, is developed to offer more details about each animal, included, name, sex, micro-chip number (where possible or available), health (eyes, skin, leg and other body) conditions, mahouts and their family. This investigation was carried out in 2005 and resultant findings (updated for some parameters: Cheeran, 2009; updated list of elephants, 2009), hope to objectively evaluate the current welfare and management status of these captive elephants with the hope that the State and Central governments take note on the current welfare status of these magnificent animals and take corrective action on an emergency basis.

## **Acknowledgements**

The survey was carried out with financial assistance from the World Society for Protection of Animals (WSPA), UK. We are grateful to a generous donor for kindly granting his mileage points for our senior scientist to travel from Bangalore to Jaipur, to conduct a survey of the elephants and subsequent interviews with their mahouts or the local elephant handlers.

We are grateful to the Help in Suffering (HIS) and Elephant Family team members, Ms. Christine Townend, Dr Sunil Chawla, Dr. Jack Reece and others at the HIS sanctuary in Jaipur for their hospitality and sharing of relevant information.

We are also grateful to Savitha Nagabhushan for her voluntary trip to witness and give a report and photographs of the elephants' participation in the Holi festival in Jaipur, as a commercial tourism activity and to Nirupa Rao for providing valuable editorial support.

## **Section 1:**

### **Captive elephants in Rajasthan**

## Executive Summary

Elephants seem to have been maintained in Rajasthan, more specifically in Jaipur, during the period of Kings/Queens for war/other reasons. Keeping elephants in unsuitable areas and enforcing a human controlled way of life that deviates from the normal lives of free-roaming elephants affects the psychological health of these animals (Bradshaw, 2007). Health issues such as chronic foot problems, abnormal weight and susceptibility to diseases (Mikota, et al., 1994) have been reported.

Welfare status of the captive elephants has been assessed by comparing physical/ physiological/ social and psychological features in captivity with those observed in the wild. Deviations from conditions in the wild have been considered to represent poor welfare. The greater the deviation, the poorer is the welfare. Deviation from the wild state for the parameters observed was rated using a scale developed by elephant experts. This survey of elephants was done in 2005; results are presented based on this survey. In 2009, a report by Dr. Cheeran, J.V., presented updated status of some of the parameters. This has been included where applicable. The list of elephants in Jaipur was updated in 2009.

This investigation includes observations on a total of 119 elephants (112 females, 7 males) in four locations— Amer, Jalmahal, Kunda, Mahout Mohalla (all located around Jaipur) and Jaipur. The age of female elephants ranged from 3 - 50y and male from 28 -50y. By 2009, five elephants had died, all adult females, aged between 30-50y and no new elephants were brought into Jaipur or its surrounding areas. All the elephants were reported to be maintained for activities such as hiring out to functions (marriages/ festivals) or for providing tourist rides and related activities. Mean Rating (M-R) for the observed elephants was 0.0 implying no natural conditions and use for commercial purposes only, showing a deviation of 100% from Expert Rating (E-R).

The animals were brought in from eight different states of the country (including Rajasthan). Of these, Uttar Pradesh contributed 32 elephants, followed by Delhi (18), Bihar (16), Assam (13), Rajasthan (6) and other states contributing less than five animals with one elephant being brought/ bought from a circus. Eighty percent of the elephants had spent 10y or less with 60% said to have spent 5 years or less in Jaipur. M-R for this parameter was 1.5 indicating a deviation of 75% from E-R.

All the elephants were provided with a shelter measuring 18 X 21ft., 6 X 7m, 21 X 7ft., the shelter had a common roof across this space. Combinations of sand and stone or just cement or only stone were the floors provided to the animals. Overall M-R was 2.6 implying a deviation of 68% from E-R. The shelter for elephants, in 2009, had improved as barns were constructed with high roofs to provide for ambient temperature within.

Borewell water was provided through taps, the bathing place was the *Pilkhana* (shelter/ feeding place) and the duration of bath was 2-3h, elephants were scrubbed using Pumice stone. M-R was 2.8 indicating a deviation of 66% from E-R. In 2009, water was available ad lib within the barns/ shelters and elephants were watered to cool them.

All the elephants were walked on tarred roads as part of their work routine, distance from *Pilkhana* to work was around 4km and all the animals were walked by their mahouts/ cawadis. M-R for walking (based on nature of terrain and time of day) was 2.0 indicating a deviation of 75% from E-R. All the observed elephants were allowed opportunity for interaction; however, only owners with more than one elephant enabled any sort of interaction for their animals. M-R for interaction opportunity was 7.9 showing a deviation of 1.1% from E-R. Elephants were chained when in the *Pilkhana*; while walking/and working, elephants are not chained, and none of the elephants were allowed to free range. M-R was 0.3 implying a deviation of 96% from E-R.

All the elephants were used for tourism related work; providing rides, attracting tourists; they were also hired out to festivals/ functions, the animals were made to seek money from the public. Tourist rides involved carrying two persons for a distance of 100m using a *howdah* (saddle) weighing 100kgs; *howdah* was made of iron pipes enclosing bedding material. Place of work and shelter were not the same and the work was said to be situated 3 to 6km from the *Pilkhana*. Elephants were worked all days of the week with the main season said to be March-May. M-R was 1.3 showing a deviation of 83% from E-R. In 2009, the work was restricted by reducing the number of trips and not carrying tourists on the way down in Amer fort; shade was available in between periods of work

All the elephants were given only stall feed, the food given included Jowar/ Sorghum straw, Jaggery (sweet derived from sugarcane), Chapatti (a kind of roasted bread made of wheat) and sugarcane. M-R was 1.9 with a deviation of 79% from E-R. The food provided had improved in 2009, as mixture of brwose and grass was given, greens provided a source of Vitamin A to the elephants

Among the adult females, only three elephants had given birth; these elephants were already pregnant when they were brought into Jaipur, two from Uttar Pradesh and one from Arunachal Pradesh; of the calves born two were alive. Among the adult males, only one was said to exhibit musth symptoms annually. M-R was 4.6 with a deviation of 42% from E-R being observed.

Ninety percent of elephants had one or more of the following problems associated: with foot pad / eyes; were observed to have abscesses/ wounds from the howdah. All the elephants had been dewormed (three times/ year), immunized against Tetanus, oil applied on head and body weekly or seasonally, biochemical tests of blood done annually. M-R was 6.2 implying deviation of 12% from E-R. In 2009, five adult female elephants had died, cause was not known.

A veterinary doctor was available for all the elephants with 6yrs experience in treating elephants. The frequency of the doctor's visit was daily and service/ Health/ Medical Records were maintained. M-R was 5.4 indicating a deviation of 32% from E-R. The overall M-R was 3.7 which show a deviation of 53% from E-R. Thus, irrespective of the parameter, there was a difference of 50% from the norm for the observed elephants for more than half of the observed features.

## **Recommendations**

- Provision of a natural environment with sufficient space, suitable substrate and varied vegetation will go a long way in alleviating the poor welfare of elephants in Jaipur. Such an environment may enable opportunities for expression of species-specific behaviours among the elephants. Such shelters may seem to be cost intensive, especially in the background of a population that is not permanent. But, the cost benefit in terms of better welfare to the animals is priceless. Also, if keeping elephants in such arid regions is stopped, then the question of a suitable shelter will not arise.
- Elephants are animals that need to lose heat either by loss from body surface or through the cooling action of hydration. Provision of suitable water sources with enough space for the elephant to immerse itself needs to be provided.
- Less dependence on chaining of the elephants has to be practiced. In a shelter where animals are allowed freedom to move, the stress imposed by chaining can be avoided with consequent improvement in the psychological and physical well-being of the animal.
- While carrying tourists, iron howdahs were used, each weighing 100kgs. This can be a source of injury to the region of contact on the elephant's skin due to constant movement of the saddle/ poor ventilation. A recent introduction, on a trial basis, has been a howdah prepared by NGOs working with elephants (accessed online<sup>2</sup>). The new howdah is said to weigh only 20kgs and has a protective rubber mat underneath.
- Provide information to tourists on the ill-effects of keeping elephants in regions in which they are not found naturally and in unsuitable living conditions
- Regular monitoring of the movement of elephants from/to Jaipur
- Regular monitoring of captive elephant management practices being followed
- Fixing a minimum salary for handlers, provision for insurance/ health cover
- Greater implementation of enrolling handlers' children in schools

### **Efforts initiated:**

- While carrying tourists, iron howdahs were used, each weighing 100kgs. This can be a source of injury to the region of contact on the elephant's skin due to constant movement of the saddle/ poor ventilation. A recent introduction has been a howdah prepared by NGOs working with elephants (accessed online<sup>2</sup>). The new howdah is said to weigh only 20kgs and has a protective rubber mat underneath.
- Provision of shade while waiting for tourists at Amer: a shed has been built for elephants to stand as they wait between periods of work

## **Introduction**

Captive elephants by virtue of their association with people are maintained in regions where their wild counterparts have never been recorded. Elephants seem to have been maintained in Jaipur during the period of Kings/ Queens, for war/ other reasons. In India, arid/ semi-arid regions for example, Jaipur, experience extreme temperature variation (ranging from 40-10°C) across seasons. This ambient temperature could prove harmful to elephants' physical condition in view of their biology, thermoregulatory mechanisms and restrictions forced by captive work situations/ living environment. The twin practice of maintaining elephants in unsuitable areas and imposing a human controlled way of life can have negative consequences on the elephants' physical and psychological well-being.

## **Objective**

Welfare status of elephants may be affected when kept in conditions alien to their normal environment. This investigation aims to:

- Assess the welfare of captive elephants in and around Jaipur city through a series of physical, social, health and management features

## **Method**

Maintaining elephants in conditions alien to their natural living environment with little or no opportunity to perform species-typical activities may result in expression of abnormal behaviours such as stereotypy/ homicide (Bradshaw, 2007).

Data was collected through observation of elephants/ interview of relevant personnel in the institution. Welfare status of the elephants has been assessed by comparing physical/ physiological/ social and psychological features in captivity with those observed in the wild. Deviations from wild conditions have been considered to represent poor welfare. The greater the deviation, the poorer the welfare. Deviation from conditions in the wild for the parameters observed was rated using a scale developed by elephant experts.

## **The rating method**

A rating scale from zero (unsuitable conditions) to ten (suitable conditions) was used to assess the welfare status of captive elephants and their handlers. Experts (both wild and captive elephant specialists, wildlife veterinary experts, managers from protected areas administering both wild and captive elephants and other wildlife, personnel from welfare organisations and elephant handlers) were invited to assess the welfare based on welfare parameters and their significance, through an exclusive workshop conducted on the subject (Varma, 2008; Varma, et al., 2008; Varma and Prasad, 2008). Experts rated a total of 114 welfare parameters covering major aspects of captivity.

- The experts, based on their concept of importance of a particular parameter to an elephant, developed a rating for each parameter. For example mean expert rating of 8.0 (SE= 0.5, N=29) for a parameter 'floor' and 9.0 (SE=0.4, N=31) for 'source of water' was arrived at from the ratings suggested by each expert and by averaging across all the experts' values.
- A mean rating for each parameter, across all the participating experts, has been used as the Experts' Rating (E-R) which represents the importance attached to a parameter

i.e., for a parameter with 8.0 as the maximum value, only 2.0 (25%) deviation and parameter with maximum value 9.0, only 1.0 or 10% from the prescribed norm is considered acceptable.

- The rating for existing captive conditions is then graded from most suitable to unsuitable. For example, if an elephant is exposed only to natural flooring, the animal receives a rating of 8 and for entirely unnatural flooring the value is 0; if animal is exposed to both natural and unnatural flooring, the value is 4 (as  $8+0/2=8/2=4$ ). If an elephant is exposed to a natural water source, such as a river, it receives a value of 9; if the source of water is large lakes or reservoirs, it gets 4.5. A value of 2.25 is assigned for small water bodies like tanks and ponds. Tap water (running) gets 1.125 and if only buckets, pots, and tankers are in use, then the allocated value is 0.5625. This rating is then averaged across all individuals in that institution to get a Mean Rating (M-R) for that feature. Thus M-R represents the actual situation existing for the elephant/s.
- Therefore, using the maxima given by experts as a base, a rating scale starting from zero to the particular maximum value for that parameter has been used and the data for each animal was collected, in a given regime (for example, forest camp or temple).
- In this investigation, variables which represent a common feature of the captive condition have been grouped to form a parameter. The variables have been termed sub-parameters. For example, the variables shelter type, shelter size, floor type in the shelter— all represent different aspects of the physical space provided to the elephant. Hence, they are grouped together to form the parameter “Shelter” and each constituent variable is a sub-parameter. In this investigation, the E-R for a parameter (say, shelter) represents the mean of E-Rs across all related sub-parameters. The Mean Rating (M-R) for a parameter is the mean of M-Rs across related sub-parameters and denotes welfare status of existing conditions on the ground for the particular parameter.
- The number of such related parameters (sub-parameters) varies for each regime.
- Results have been presented comparing E-R and M-R as a means of comparing the extent of deviation present in the parameters observed. The difference between E-R and M-R (expressed as percentage) indicates deviations from the prescribed norm.
- For handlers, the difference between the maxima provided by experts (E-R) and existing status (M-R) have been used to indicate their professional/ socio-economic status, of value to the handler and his elephant.
- N\* refers to number of sub-parameters observed. N refers to number of individuals.

## Result

This report includes observations on a total of 119 elephants (112 females, 7 males) in four locations— Amer, Jalmahal, Kunda, Mahout Mohalla (all located around Jaipur) and Jaipur. The data collected has been pooled together to constitute elephants of Jaipur. Respective ages and numbers, segregated by sex, are provided in Figure 1. Females ages ranged from 3 - 50yrs and the males ages from 28 -50yrs.

Figure 1: Age-sex distribution of elephants in Jaipur

The total number of elephants observed in 2005 was 119; by 2009, five adult female elephants had died. Figure 2 and 3 give comparative occurrence of age groups across both years. In 2005, males and females in the age group of 16-40y accounted for 71.4 and 91% of all elephants whereas in 2009, this was 75 and 57% respectively. There were no additions among calves, despite the predominant occurrence of females of breeding age.

Figure 2: Age class distribution in the year 2005

Figure 3: Age class distribution in the year 2009

### Purpose of keeping

When commercial interest is the sole reason for keeping elephants, use/ overuse of the animals is a likely outcome as income generation may outweigh all other considerations. Along with this, needs of the animals may not be given priority, if at all. High rating has been assigned to those elephants which are kept in semi-natural/ natural conditions with no commercial interest.

All the elephants were reported to be maintained for activities such as hiring out to functions (marriages/ festivals) or for providing tourist rides and related activities. M-R for the observed elephants was 0.0 (SE= 0.0, N= 119) implying no natural conditions and use for commercial purpose only, showing a deviation of 100% from E-R.

## Source of elephants

Whether the elephants are captive born/ have been shifted across owners or locations, is important to the animals' welfare as they may undergo different management systems, maybe exposed to new elephants, new handlers, etc., all factors capable of causing stress and poor welfare. Figure 2 gives a comparison of elephants' years of residence in Jaipur and handlers' experience per elephant.

- The elephants were either purchased or were moved from another region to their present location.
- The animals were brought in from eight different states of the country (including Rajasthan). Of these, Uttar Pradesh contributed 32 elephants, followed by Delhi (18), Bihar (16), Assam (13), Rajasthan (6) and other states contributing less than five animals with one elephant being brought/ bought from a circus.
- Mean duration of stay in Jaipur for the elephants was 5.6y (SE= 0.6, N=91)
- Eighty-seven percent of the elephants had spent 10 yrs or less with 58% said to have spent 5 yrs or less in Jaipur (Figure 2). This would imply introduction of new elephants into the city, not those maintained originally by Royalty and then handed over to mahouts/cawadis.
- From Figure 4, it can be seen that the percentage of occurrence of both variables— time spent by elephants in Jaipur and time spent by handler with an elephant— follow a similar pattern. However, maximum percentage of occurrence of duration spent with an elephant by a handler exceeds that of the period of stay by elephants in Jaipur implying a disjunction between stay in Jaipur (by an elephant) and time spent with an elephant. This maximum value was nearly 63% indicating duration of only 1-5y for a handler with an elephant. Similar duration of stay (1-5y) by an elephant in Jaipur was 37% implying shorter duration with an elephant irrespective of its stay in Jaipur.

M-R for this parameter was 1.5 indicating a deviation of 75% from E-R

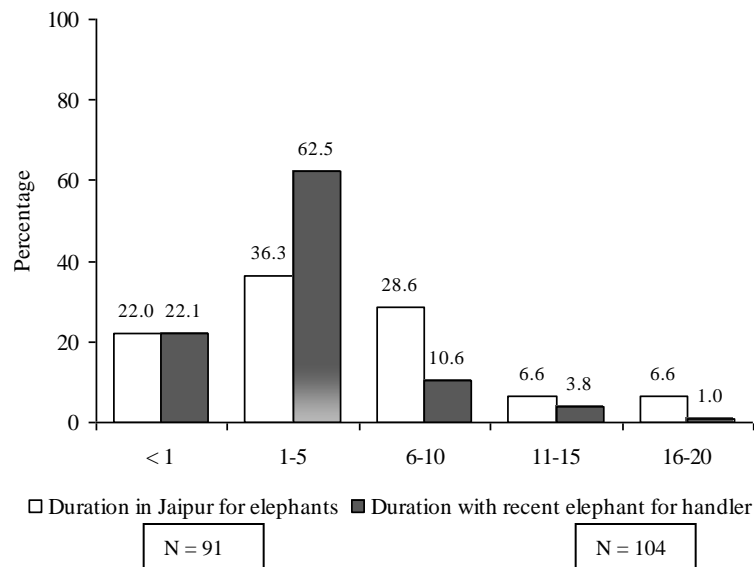

Figure 4: Comparison of duration of stay for elephants in Jaipur and period spent by handlers with each animal

## Shelter

Wild elephants are known to cover several hundred kilometers as part of their home range (Poole and Granli, 2009; Sukumar, 1989), in response to ecological and social needs. In striking contrast, captive elephants are forced to live their lives in confined spaces made of unsuitable materials.

- All the elephants were provided with a shelter (Figure 5a) measuring 18 X 21ft., 6 X 7m, 21 X 7ft., the shelter had a common roof across this space
- Flooring : a combination of sand and stone or just cement or only stone floors (Figures 5b and c)
- Shade (Figure 5d) was available for some, while there was no shade for others in the shelter
- Cleaned daily to remove dung/ food waste/ urine, cleaned with broom and phenyl, hygiene quality was poor

Figure 5a: An another example of concrete floor

Figure 5b: Enclosure and shade provided to elephants.

- The 2009 report mentions the construction of barns open on all sides with a roof high enough to provide for suitable ambient temperature within.

Overall M-R was 2.6 (SE= 1.8, N\*= 5) implying a deviation of 68% from E-R (Figures 6a and b).

Figure 6a: Comparison of E-R and M-R for ‘shelter’ sub-parameters

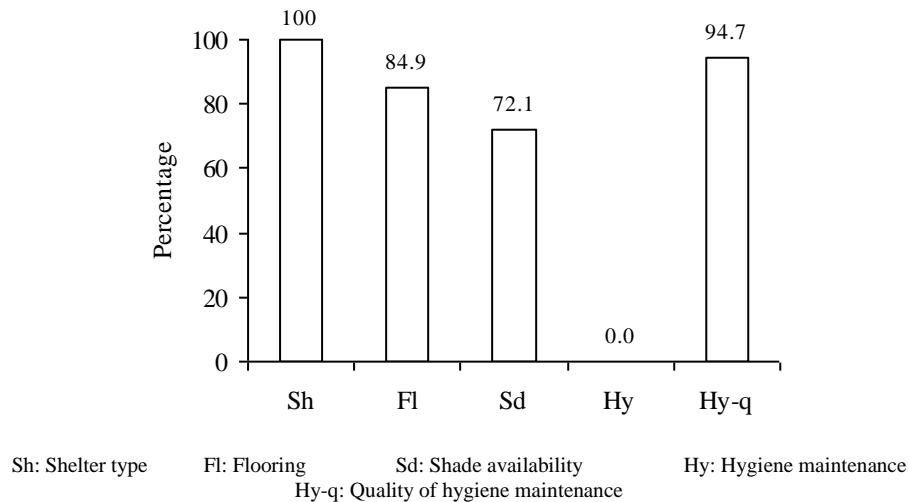

Figure 6b: Percentage wise deviation from E-R for ‘shelter’ sub-parameters

### Water and related features

Subject to availability, elephants have been observed to drink water at least once a day (Sukumar, 1991); bathing appears to have thermoregulatory properties (Weissenbock, 2006), along with aiding in socialization among conspecifics. Rating has been designed to indicate provision for unlimited supply and access to free-flowing water, access to suitable bathing areas, duration. In captivity, bathing of elephants is done by mahouts/ cawadis. Hence, the use of suitable scrubbing material has also been considered.

- Borewell water was provided through taps
- For drinking, water troughs (Figure 7a) were available, the elephants were said to drink thrice a day
- 68% elephants were reported to have insufficient/ poor / non-existent provision for water

- Bathing place was the *Pilkhana* (shelter/ feeding place) and some seasons, water stored around the fort also used for washing and bathing elephants (Figures 7b,c,d,e and f)
- Duration of bath was 2-3hrs, elephants were scrubbed using Pumice stone
- In 2009, water was available ad-lib within the barns which was said to have reversed the dehydrated state of elephants seen in previous years; the elephants were cooled by pouring water onto them while in the shelter

Figure 8b: Percentage wise deviation from E-R for 'water' sub-parameters

### Sleep related features

Excessive or little sleep may indicate signs of sickness, bad sleeping conditions such as unsuitable floors may add to health problems.

- Sleeping place was the *Pilkhana*
- Sleep duration was 4h and during the night.
- The elephants were tied with a 3m chain during this period

M-R for two sub-parameters was: sleep area (M-R = 1.0, SE= 0.0, N= 119) and sleep duration (M-R = 8.0, SE= 0.0, N= 119). There was 88% deviation from E-R for sleep area and no deviation for sleep duration.

### Walk

Wild elephants have been observed to traverse several kilometers while foraging/ engaging in other activities (Poole and Granli, 2009). When animals known to be active for most parts of a day are not provided an opportunity to walk or move about, it may result in health and psychological problems.

- All the elephants were walked on tarred roads as part of their work routine (Figures 9a,b,c,d,e,f, and g)
- Distance from *Pilkhana* to work was around 4km

a

b

c

d

e

f

g

Figures 9a, b, c, d, e, f and g: Walking as part of work routine on different terrains

- All the animals were walked by their mahouts/ cawadis

M-R for the two observed sub-parameters was: Opportunity to walk (M-R= 9.0, SE= 0.0, N= 119) and time of walk (M-R = 2.0, SE= 0.0, N= 119). There was no deviation for the first sub-parameter while there was 75% deviation for the second sub-parameter.

### **Social interaction**

Elephants are considered to be social animals, maintaining long-lasting relationships across generations (Sukumar, 2003).

- All the observed elephants were allowed opportunity for interaction (Figures 10a,b,c,d,f,g and h)
- Data on related aspects such as duration, number of individuals and distance from each other, was not available
- Duration depended on work schedule, after work the elephants were chained in close proximity
- Only owners with more than one elephant enabled any sort of interaction for their animals

a

b

c

d

e

f

Figures 10a, b, c, d, e and f: Scope for interaction among elephants during different occasions

M-R for opportunity to interact was 7.9 (SE= 0.1, N= 22) with a deviation of 1.3% from E-R.  
M-R for duration of interaction was 3.5 (SE= 0.0, N=22) with a deviation of 50% from E-R.

### Chaining

Elephants in captivity are subject to periods of chaining as a means of management. Their ability to move by choice is severely restricted by this practice.

- All elephants were said to be chained (Figures 11a, b and c) in the leg region
- Region of chaining varied from chaining front leg with 3m chain and back leg with rope / chain to never chained on back leg
- Elephants were chained when in the *Pilkhana*
- While walking/ and working, not chained
- None of the elephants were allowed to free range

a

b

Figures 11a and b: Chaining of elephants during non-work hours at the shelter; note both legs are chained and for one elephant a rope has been used on the hind leg

Figure 11c: calf's chain tied to mother's neck chain

M-R was 0.3 (SE= 0.3, N = 3) implying a deviation of 96% from E-R (Figures 12a and b).

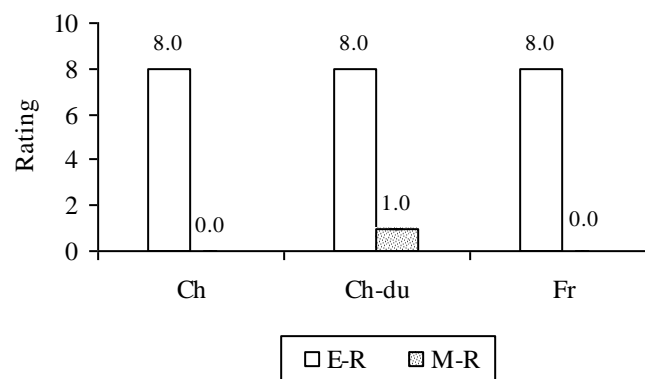

Figure 12a: Comparison of E-R and M-R for 'chaining' sub-parameters

Ch: Chaining status

Ch-du: Duration of chaining

Fr: Opportunity to free-range at night

Figure 12b: Percentage wise deviation from E-R for 'chaining' sub-parameters

## Behaviour

Manageability of elephants, occurrence of aggression towards people and occurrence of stereotypy was considered for rating.

- 13% of the elephants (N=115) were described as aggressive and/ or nervous, the remaining were said to be friendly
- Three adult female elephants had injured/ killed people, while two adult females had attacked other animals
- 10-15 elephants were said to exhibit stereotypic signs of medium intensity

M-R was 3.7 (SE = 2.5, N\*= 3) showing a deviation of 54% from E-R (Figures 13a and b).

Figure 13a: Comparison of E-R and M-R for ‘observed’ behaviour

B: Observed behaviour

St: Occurrence of stereotypy

In-st: Intensity of stereotypy

Figure 13b: Percentage wise deviation from E-R for ‘behaviour’ sub-parameters

## Work

A captive elephant’s nature of work determines, to a large extent, its living conditions and location.

- All the elephants were used for tourism related work (Figures 14a,b,c,d,e,f,g,h and i) — providing rides, attracting tourists; they were also hired out to festivals/ functions, the animals were made to seek money from the public
- Tourist rides involved carrying two persons for a distance of 100m using a howdah (saddle) weighing 100kgs; howdah was made of iron pipes enclosing bedding material

Figures 14a, b, c, d, e, f, g, h and i: different work types exposed to elephants a and b: carrying tourist to the fort (a) climbing down c; being part of State tourism festival, d and e made to stand in street for attracting tourists and for photo sessions, e and f; decorated to be displayed in functions, g: *howdah* used carry tourist, i: getting ready for carrying tourists

- Place of work and shelter were not the same— work was said to be situated 3-4 to 6km from the *Pilkhana*
- Elephants were worked all days of the week with the main season said to be March-May; average temperature during period varies from 31-40°C

- No shade/ water was available while working
- Food provided while working was Sugarcane (*Sacharum* sp.), sorghum or jowar (*Sorghum bicolor*) straw, Lucerne (*Medicago* sp.)
- By 2009, the number of tourists per ride was reduced, restricted number of trips and no tourists were carried on the way down from the fort in Amer; shade was provided at the resting place between trips

M-R was 1.3 (SE= 0.0, N\*= 6) showing a deviation of 83% from E-R (Figures 15a and b).

Figure 15a: Comparison of E-R and M-R for ‘work’ sub-parameters

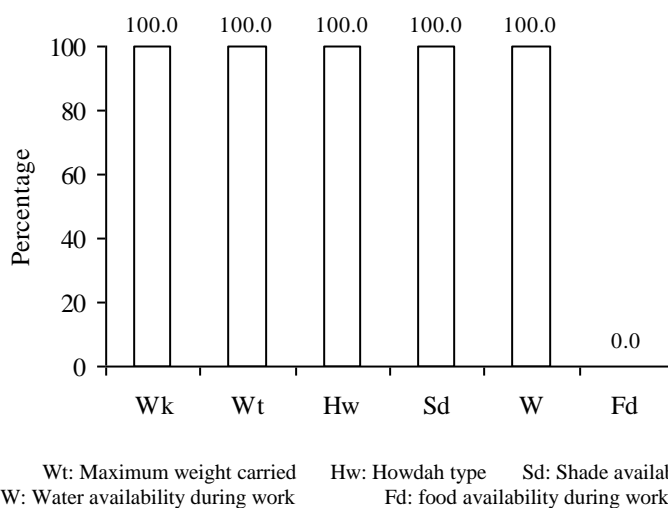

Figure 15b: Percentage wise deviation from E-R for ‘work’ sub-parameters

### Provision of food

Being generalist in their feeding habits (Sukumar, 1991); wild elephants have been observed to feed on a wide variety of plants. In captivity, not only is such variety missing but also the performance of species-typical foraging behaviour is curtailed by the use of stall-feed. In terms of management, usage of ration charts can help in maintaining a record of the food eaten by the elephants (across different health states).

- All the elephants were given only stall feed and see Figures 16a,b,c,d,e and f for types of food given to elephants in Jaipur
- Food given included Jowar/ Sorghum straw, Jaggery (sweet derived from sugarcane), Chapatti (a kind of roasted bread made of wheat) and sugarcane
- Mineral mix was not given daily, it was need based;
- Feeding duration was 18-20h (in the *Pilkhana* and while working)
- Feeding place was cleaned daily
- By 2009, the elephants were provided with a mixture of browse and grass, thereby, reducing the occurrence of constipation/ impaction; mineral mixture was provided

a

b

M-R was 1.9 (SE=1.1, N\*= 4) with a deviation of 79% from E-R (Figures 17a and b).

Figure 17a: Comparison of E-R and M-R for 'food' sub-parameters

Fd: Food provisioning type      Fd-du: Feeding duration  
 Fd-n: Number of food items      Rt: Ration chart usage

Figure 17b: Percentage wise deviation from E-R for 'food' sub-parameters

## Reproductive status

Figure 18: Female with her calf which she gave birth to after reaching Jaipur

Normal reproductive functioning in adult elephants can be considered to be a sign of health. In captivity, various causes like social isolation, poor nutrition, stress, etc., have been associated with poor reproductive success.

- Among the 112 adult females, status of only three elephants was known; all three had given birth; these elephants were already pregnant when they were brought into Jaipur (Figure 18), two from Uttar Pradesh and

one from Arunachal Pradesh; of the calves born two were alive

- Data regarding status of oestrus cycles/ mating observed/ pregnancy of other female elephants was not available
- Among the males, three were said to exhibit musth symptoms annually
- The males were isolated and chained while in musth

M-R was 4.6 (SE= 2.8, N\*= 3) with a deviation of 42% from E-R being observed (Figures 19a and b).

Figure 19a: Comparison of E-R and M-R for 'reproductive' status sub-parameters

Cl: Calves born/ not

Mu: Occurrence of musth

Mu-h: Handling of musth

\*: Data based on observations of three elephants only

Figure 19b: Percentage wise deviation from E-R for 'reproductive' status sub-parameters

### Health status

Physical health of the elephants is important not only in terms of survival but also for its effect on psychological well-being. Regular adherence to prescribed veterinary schedules helps in maintaining health.

- Ninety percent of elephants had one or more of the following problems (Figures 20a,b, c,
- Figures 20 d and e): foot pad / eyes/ were observed to have abscesses/ wounds from the howdah

a

b

Figure 20a and b, Injuries to the eye (a), sun burns (b).

c

d

e

Figure 20c, d and e, Injuries to leg

- All the elephants had been dewormed with Albendazole/ Fenbendazole (three times/ year), immunized against Tetanus, oil applied on head and body weekly or seasonally, biochemical tests of blood done annually
- Body condition was described as average for 68% of the elephants
- Five adult females, aged between 30-50y, had died by the year 2009
- The 2009 report states that all the elephants were dewormed every quarter, veterinary care was timely which resulted in maintaining the health of the elephants; the body condition of elephants was described as good; the addition of Lucerne and sugarcane helped in reducing the occurrence of eye lesions and improved skin condition

M-R was 6.2 (SE= 0.9, N\*= 9) implying deviation of 12 % from E-R (Figures 21a and b).

Figure 21a: Comparison of E-R and M-R for 'health' sub-parameters

Na: Nature of disease/ injury   Bd-c: Body condition   Dw: Deworming status  
Dw-f: Frequency of deworming   Vc: Vaccination status   Ol: Oiling status  
Ol-f: Frequency of oiling   Ts: Tests of blood/ dung/ urine   Ts-F: Frequency of tests

Figure 21b: Percentage wise deviation from E-R for 'health' sub-parameters

### Veterinary care and infrastructure

Availability and access to doctors with relevant experience is integral to maintaining health of elephants. Facilities (relevant to veterinary practice and infrastructure) are just as important. Availability of funds and expenditures have been considered as they form the central part of any captive elephant situation. Usage of funds for maintenance of a natural set-up with few accessory expenses involved has been considered to be ideal.

Figure 22: Dedicated mobile clinic run by Help in Suffering and Elephant Family

- A veterinary doctor was available for all the elephants with 6y experience in treating elephants
- Frequency of doctor's visit was daily
- Veterinary assistant was not available
- Following facilities were available: staff quarters, cooking shed, provision shed, camp site, mobile veterinary clinic (Figure 22)
- Service/ Health/ Medical Records were maintained
- Funds: Owners earned money from the tourist rides at Amer which was Rs.570/ ride. Of this, Rs.450/- was taken by the owner.

M-R was 5.4 (SE= 0.0, N\*=9) with a deviation of 32% from E-R (Figures 23a and b).

Figure 23a: Comparison of E-R and M-R for 'Veterinary care and infrastructure' sub-parameters

Vt-d: Availability of veterinary doctor Ex-E: Experience with elephants Ex-n: Number of years of experience  
 VS: Frequency of visits Vt-a: Availability of veterinary assistant Rc: Maintenance of records  
 Fc: Facilities available Fn: Availability of funds Fn-ex: Expenditure of funds

Figure 23b: Percentage wise deviation from E-R for 'veterinary care and infrastructure' sub-parameters

Each of the sub-parameters considered has been compared with an E-R and any deviation noticed is indicative of the deviation from what the experts consider to be a situation suitable for elephants in captivity. Figure 24 gives the distribution of this deviation across the sub-parameters observed. It can be seen that more than half of the total sub-parameters (total =56), that is, 31 sub-parameters show a deviation of 60% or more from E-R. Only 19 sub-parameters show a deviation of 20% or less from E-R.

Figure 24: Distribution of percentage wise deviation from E-R across all sub-parameters

### Overall rating for elephants

The welfare status of elephants maintained in Jaipur has been evaluated by considering the deviation from the living conditions observed for wild elephants. The overall M-R (considering all parameters together across all observed elephants) was 3.7 (SE= 0.5, N\*= 55) which shows a deviation of 50% from E-R. Thus, irrespective of the parameter, there was a difference of 50% from the norm for the observed elephants.

### Handlers' experience and socio-economic status

Mean age of handlers was 29.1y (SE= 0.7, N= 116) ranging from 18-57y. Most handlers (65%) were also trained as *phandis* (elephant catchers using noose).

#### Experience:

An inexperienced handler and an aggressive elephant may prove to be a dangerous and lethal combination. Even if the elephant's temperament is not aggressive, lack of knowledge about the elephant may result in poor care.

- Age when each began working with elephants ranged from 0-40y (Mean = 14y, SE= 0.7, N = 111).
- Mean duration with current elephant was 3.2yrs (SE= 0.4, N= 104) ranging from 0.16- 20yrs.
- The number of elephants handled before the present one varied from one to three. Experience in Jaipur (mean = 10.4y, SE= 0.8, N= 106) was comparable with other places (mean = 9.1y, SE= 1.2, N=50).

- Nearly 50% of handlers took up this profession as they could not find any other means of employment
- Most (74%) were confident of handling problematic elephants
- 54% of handlers did not want to change their profession
- The use of ankush was widespread resulting in ankush wounds on elephants; in 2009, this use was restricted and handlers were provided information on positive reinforcement training

M-R was 4.4 (SE= 1.9, N\*= 3) indicating a deviation of 49% from E-R (Figures 25a and b).

Figure 25a: Comparison of E-R and M-R for handler experience

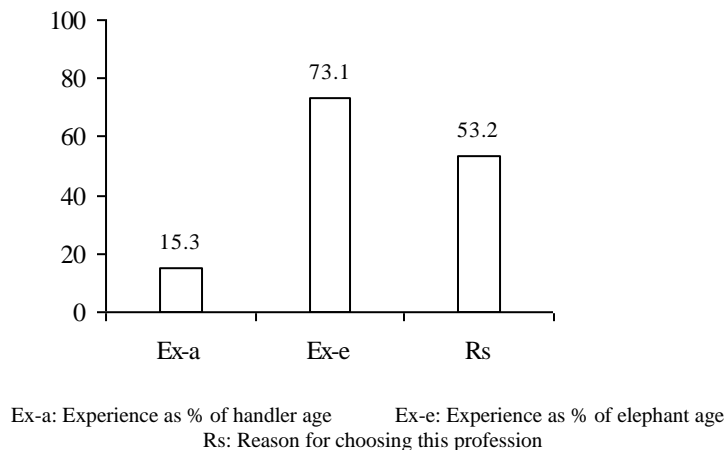

Figure 25b: Comparison of E-R and M-R for handler experience

### Socio-economic status

Lair (1997) states that mahouts hired to handle elephants are usually poor as opposed to those who own and handle their elephants. Poor remuneration or an impoverished state may lead to overexploitation/ neglect of the elephant. Along with remuneration, features such as education level, marital status and liquor consumption habits were rated.

- Only 28% (N= 108) of handlers were educated

- Mean monthly salary was Rs.1356/- (ranging from Rs800 to 8000/-) with 82% handlers earning less than Rs.2000/- per month; handlers expected a salary of Rs. 1500 to 7000/- per month
- All handlers earned extra through tips
- 80% of handlers did not want their children to work in this profession
- Monthly expense ranged from Rs.400 to 6000/- (mean = Rs.2590/-)
- Mean number people in the house was five, ranging from 1-12
- Mean number of children per household was three, ranging from 0 – 10; the number of sons/ daughters born was similar, with sons surviving better than daughters.
- Wives of handlers did not work outside, all were housewives
- Handlers were said to use intoxicants like cannabis/ alcohol

A training program was organized, according to the report in 2009, for handlers on methods of treating elephants for common ailments such as wound dressing/ foot-care/ maintaining shelter hygiene

M-R was 3.1 (SE= 1.3, N\*= 3) indicating a deviation of 55% from E-R (Figures 26a and b).

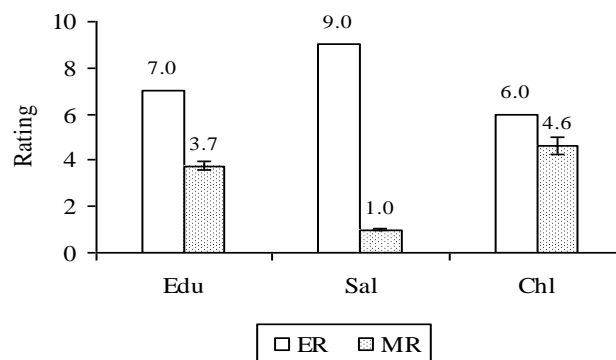

Figure 26a: Comparison of E-R and M-R for handler socio-economic status

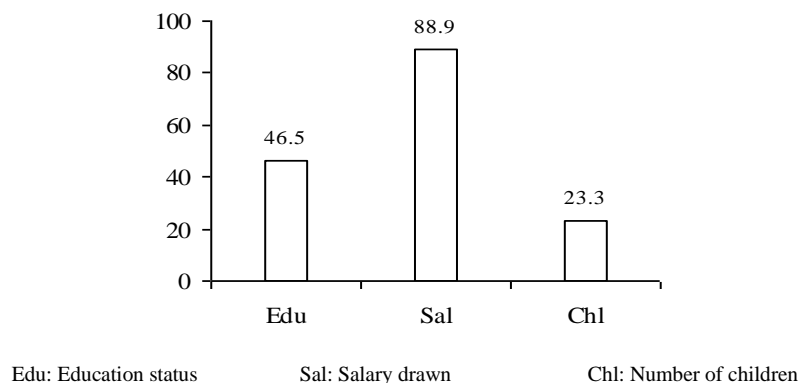

Figure 26b: Percentage wise deviation from E-R for socio-economic status of handler

## Discussion

The differences in living conditions (physical/ social) experienced by elephants in captivity can be compared with the lives of free-ranging wild elephants, and can be used as being indicative of the stress/ trauma undergone in captivity (Bradshaw, 2007).

Parameters which showed 75% or more deviation from E-R:

- Source of elephants: all the elephants had been shifted from different locations with 58% spending 5y or less in Jaipur. The elephants would have had to acclimatize to the hot, dry conditions in Jaipur.

Pinter-Wollman et al., (2009) studied the effects on wild elephants translocated from a humid, equatorial climate to a semi-arid area in Kenya. It was found that the translocated elephants' body condition was significantly lower than that of the resident population with no difference in stress hormone levels.

Shifting from one region to another may involve change in management routines/ work schedule/ breakage of established bonds among elephants in the previous location.

Most of the handlers in Jaipur spent between 1-5y only with his elephant indicating added change in the elephants' lives in the form of frequent change of handler. Thus, the elephants would have to adjust to a changed living environment and a different handler frequently.

Both these factors (change of location and change of handlers) are sources of physical/ physiological/ psychological stress to the elephants.

- Shelter: the region of Jaipur is not a natural range area for elephants as wild elephants have not been reported from this area. Added to this alien environment, the animals were housed in shelters with unsuitable floors, restricted space and absence of a natural, vegetated environment. For animals evolved to travel several kilometers across varied natural habitat, restriction in limited man-made space can be a source of stress (Bradshaw, 2007).
- Source of water: none of the elephants had access to sources which promoted expression of species-typical behaviours such as bathing/ wallowing/ provision of rubbing posts. In fact, the quantity provided was described as being insufficient for 68% of the observed elephants. Inadequate water availability can be life threatening in arid regions, a fact of significance considering the poor thermo-regulatory capability of the elephants' skin, also their inability to move and access water as a consequence of chaining or their work schedule.
- All the elephants were chained when not working, without any opportunity to free range implying forced helplessness with regards to accessing resources such as water/ companions/ suitable space. Gruber et al., (2000) states the increased frequency of stereotypy among chained animals as opposed to those that were penned. In addition, persistent chaining can lead to abrasive injuries (Kurt and Garai, 2007) which may be difficult to heal.
- Absence of free-ranging opportunity meant no provision to graze/ browse in suitable habitat. Wild elephants are known to be active for most parts of a day (Poole and Granli, 2009) spending 12-18h of a day (Sukumar, 1991) in foraging/ feeding. Hence, just

providing stall feed for 18-20h in captivity may not be suitable for two reasons— lack of mental stimulation in the absence of ability to move and engage in species-typical activity and a potential deficiency of exercise for elephants that are chained when not working

- Work: all the elephants were used for work: carrying tourists, taking part in festivals/ seeking money from the public, etc. While this may seem innocuous enough, chances of overworking elephants to generate income can be real, more so, when the funds generated from this activity had to be shared between the owner/ handler and used for maintaining the elephant. In addition, there was no shade or water availability while working – a serious handicap considering the ambient temperature of Jaipur during daytime.
- Disease/ disorder noticed in elephants in Jaipur:  
Common problems noticed among the elephants were:
  - Foot-rot
  - Foot-pad/ toe nail problems
  - Lameness
  - Abscesses/ lacerated wounds
  - Death of five adult female elephants by 2009

Olson et al., (1994) state regular care of the feet is needed to prevent overgrown soles/ nails/ penetration of foreign bodies/ abscesses / foot-rot. Absence of care can lead to persistent infection and even death. It is significant to note that despite provision of regular veterinary care, elephants in Jaipur in the prime of their age showed the above mentioned injuries. This could be related more to the management/ husbandry practiced with these elephants.

In an earlier study of the health of Jaipur elephants, Ashraf et al., (2001) noted that nearly 36% of the observed elephants had eye related problems. In this study, the occurrence of eye associated disease/ disorder was around 15%. This is an indication of the improved health status as both studies involved the same elephants. 10 of the 12 elephants however, having eye problems in this study were between 20- 40y, a prime age for long-living elephants.

The situation for elephants in Jaipur is replete with forced alien conditions: frequent shifting of locations, changes in mahout, unnatural living conditions with little provision for expression of species-specific behaviours, all-pervasive influence of human control on all facets of the animal's life— factors that may pre-dispose the elephant to stress (psychological and physical) leading to poor welfare and reduced life span.

#### Mahouts/ Handlers

- Frequent change of handlers for each elephant can endanger the life of the animal/ the handler as each needs to undergo a period of adjustment. It is not known why such changes were observed for elephants in Jaipur.

- Salary paid to mahouts showed a deviation of 89% from that recommended by experts. This deviation becomes even more significant as each household had a mean of five persons.

Innovation Centre, Indian Institute of Science, Bangalore 560 012

**Compassion Unlimited Plus Action (CUPA)** is a non profit public charitable trust registered in 1991 that works for the welfare of all animals. Since 1994, CUPA has worked in close collaboration with government departments and agencies on various projects. CUPA's mission is to protect animals from abuse and violence and do what may be required in alleviating suffering at the hands of humans. CUPA does not differentiate between pet, stray or wild animals, since all often require assistance and relief from cruelty, neglect and harm. The organization's objective has been to design services and facilities which are employed fully in the realization of these goals.

**Asian Nature Conservation Foundation (ANCF)** is a non-profit public charitable trust set to meet the need for an informed decision-making framework to stem the rapidly declining natural landscape and biological diversity of India and other countries of tropical Asia. The foundation undertakes activities independently and in co-ordination with Government agencies, research institutions, conservation NGOs and individuals from India and abroad, in all matters relating to conservation of natural resources and biodiversity, endangered flora and fauna, wildlife habitats and environment including forests and wetlands. It participates and disseminates the procured information, knowledge and inferences in professional, academic and public forums.

**Help in Suffering:** The Help in Suffering (HIS), a charitable trust, has marked 25 years of service to the protection and welfare of street animals in Jaipur, Rajasthan. HIS spends Rs 4 lakhs per month on various projects with 5 vans touring the city areas daily to bring in animals that are suffering and need veterinary intervention. HIS works on the streets, picking up dying puppies from the gutters, saving dogs from being poisoned and any other animals that may need help. One of the long term dreams of the organization is to build an elephant refuge for those elephants that can no longer work. Funds and exchange programmes from UK, France, and USA give HIS a wonderful international network, leaving all the people involved, with hands on learning experience with animals like camels and elephants. They depart carrying with them the amazing spirit of survival so typical of this country.

**Elephant Family:** Registered in 2002, *elephant family* has developed into a focused force for the endangered Asian elephant. Elephant family vision is a world in which the Asian elephant is no longer an endangered species and is able to live unthreatened within its own habitat. Elephant family currently supports a number of projects across India, Indonesia, Malaysia and Thailand. Elephant family's activities range from securing vital wildlife 'corridors' and helping remote farming communities to live safely inside wild elephant territory, to rescuing abused street elephants and providing free veterinary care. These projects fall under three core areas of work: (1) habitat conservation; (2) health & welfare; and (3) education. *Elephant family* only partners with rigorously selected grassroots organizations best equipped to achieve significant results on the ground.

**World Society for Protection of Animals (WSPA)** With consultative status at the United Nations and the Council of Europe, WSPA is the world's largest alliance of animal welfare societies, forming a network with 910 member organizations in 153 countries. WSPA brings together people and organizations throughout the world to challenge global animal welfare issues. It has 13 offices and hundreds of thousands of supporters worldwide.

Maintaining elephants in conditions alien to their natural living environment, with little or no opportunity to perform species-typical activities may result in expression of abnormal behaviors. However, there has been no initiative so far to study the ecological and physiological needs of elephants in a deviant environment which is in sharp contrast to their natural forest or grassland homes. This investigation is an attempt to gain some knowledge about captive elephants in human dominated and influenced surroundings of Jaipur, Rajasthan
